

# Air Pollution

Does it adversely affect our health?

Miller chapter 19

---

---

---

---

---

---

---

---

## The Composition of the Atmosphere

- 78 % nitrogen
- 21 % oxygen
- 0.93 % argon
- 0.03 % carbon dioxide
- 0.04 % of other gases.

---

---

---

---

---

---

---

---

## The Layers of the Atmosphere

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Sources can be Natural or Anthropogenic

- Anthropogenic sources have increased since industrial revolution
- Air is cleaned by **hydroxyl radicals**

**Formation of Hydroxyl**

uV Radiation

1.  $O_3 \rightarrow O_2 + O^*$   
Photochemical breakdown of tropospheric ozone releases an oxygen molecule and a free oxygen atom.
2.  $O^* + H_2O \rightarrow 2OH$   
Hydroxyl radical is continuously formed as free oxygen atoms react with water.

**Reactions of Hydroxyl with Pollutants**

Hydroxyl radical is rapidly consumed, yielding end products of carbon dioxide, nitric acid, sulfuric acid, and water.

These end products are flushed from the troposphere by precipitation, causing

---

---

---

---

---

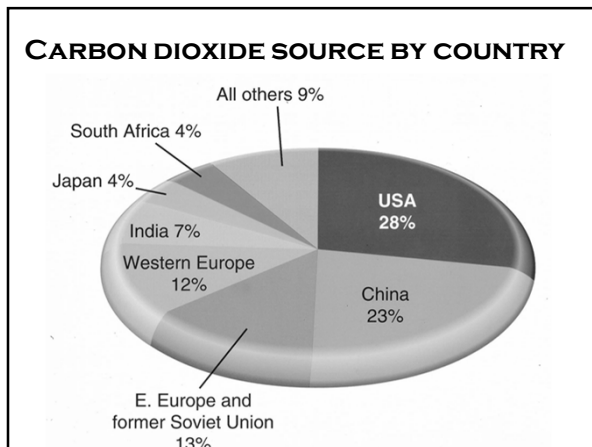

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## ANTHROPOGENIC SOURCE OF MAJOR POLLUTANTS

---

---

---

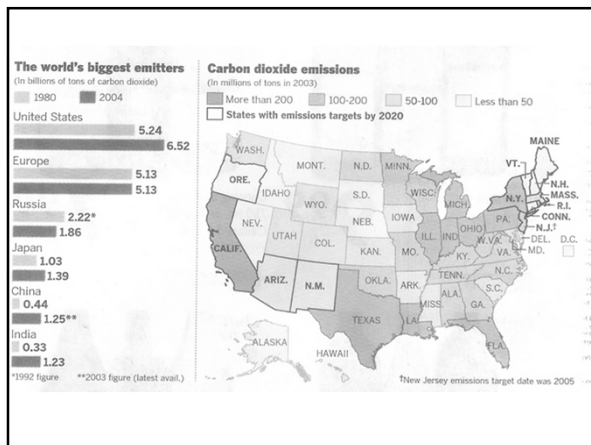

---

---

---

---

---

---

---

---

---

---

---

---

---

## Photochemical Smog

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

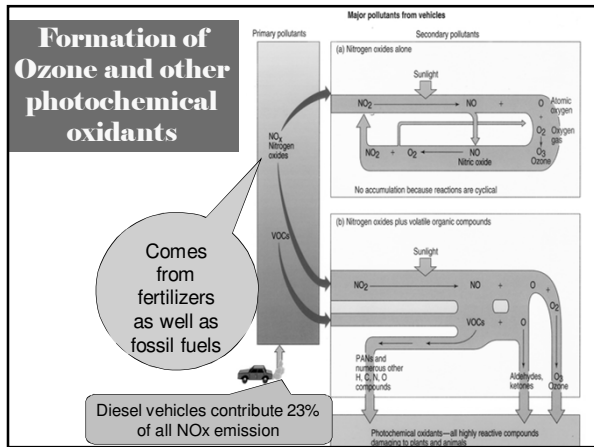

---

---

---

---

---

---

---

---

---

---

---

### Ozone (O<sub>3</sub>) Chemistry

- ☒ Ozone formation occurs in the presence of nitrogen dioxide (NO<sub>2</sub>)
- ☒ NO<sub>2</sub> + Sunlight → NO + O
- ☒ O + O<sub>2</sub> → O<sub>3</sub>
- ☒ Ozone destruction occurs in the presence of NO
- ☒ NO + O<sub>3</sub> → NO<sub>2</sub> + O<sub>2</sub>
- ☒ This natural cycle creates a balanced amount of ozone. (Steady State)

---

---

---

---

---

---

---

---

### Ozone (O<sub>3</sub>) Chemistry

- VOC converts NO back to NO<sub>2</sub>.
- NO → NO<sub>2</sub>
- As NO levels drop, Ozone accumulates
- ~~NO + O<sub>3</sub> → NO<sub>2</sub> + O<sub>2</sub>~~

---

---

---

---

---

---

---

---

### Summary reactions for ozone O<sub>3</sub>

- **High Temperatures (internal combustion engines)**  
N<sub>2</sub>(g) + 2O<sub>2</sub>(g) → 2NO<sub>2</sub>(g)
- **Sunlight reaction forming ozone**  
*\*Reversible\**  
NO<sub>2</sub>(g) + O<sub>2</sub>(g) <—> NO(g) + O<sub>3</sub>(g)
- **VOC's remove NO and Ozone remains**  
*\*Non-reversible\**  
NO<sub>2</sub>(g) + O<sub>2</sub>(g) → NO(g) + O<sub>3</sub>(g)

---

---

---

---

---

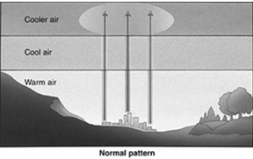

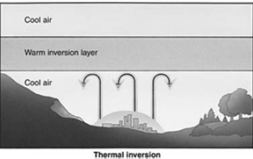

---

---

---

### Thermal Inversion Layers

- When temperature increases with altitude, it is referred to as a **temperature or thermal inversion**. **Cool air becomes trapped under warmer layer.**
- Forms in areas where the flow of air is geographically blocked by mountains

---

---

---

---

---

---

---

---

### Thermal Inversion in Los Angeles

- At surface, air cooled by the California current comes ashore on cool sea breezes.
- The dense cool air sinks into the basin as it comes onto land.
- The mountains to the east prevent air from moving out of the vicinity of the basin.
- With cool air at the surface and the warm layer aloft, inversion conditions take hold.
- The inversion limits the height to which pollutants generated by industrial activities and motor vehicles are moved.
- Under cloudless skies, insolation initiates photochemical reactions in the urban atmosphere to create the infamous smog problem that Los Angeles has.

---

---

---

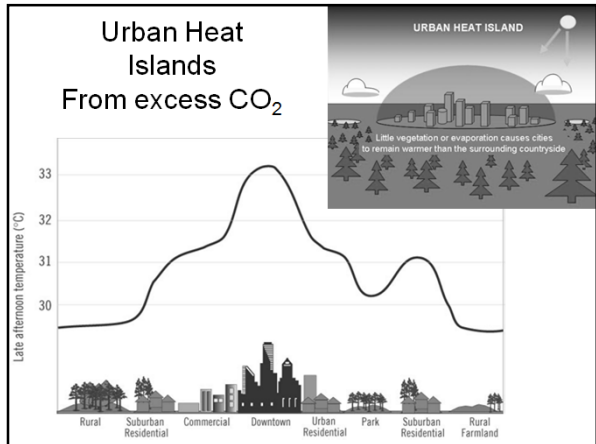

---

---

---

---

---

---

---

---

---

---

---

---

---

## Industrial Smog

---

---

---

---

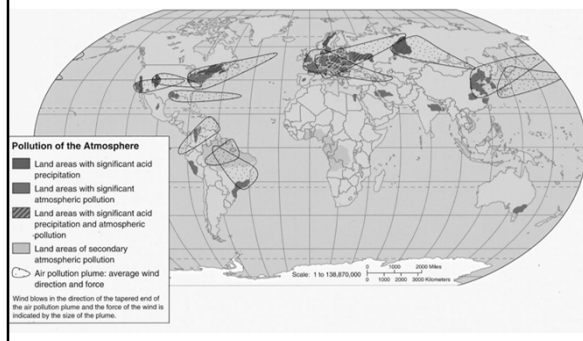

---

---

---

---

## AIR POLLUTION AROUND THE WORLD

---

---

---

---

---

---

---

---

## Acid Deposition

- Regional problem
- Sulfuric acid ( $H_2SO_4$ ) and nitric acid ( $HNO_3$ ) form from primary pollutants  $SO_2$  (coal) and  $NO_x$  (vehicles)
- Carried on prevailing winds
- Enters environment as dry acid deposition or acid rain
- Lakes in shallow soil low in limestone become acidic
- Lakes in deep soil high in limestone are buffered

---

---

---

---

---

---

---

---

---

---

---

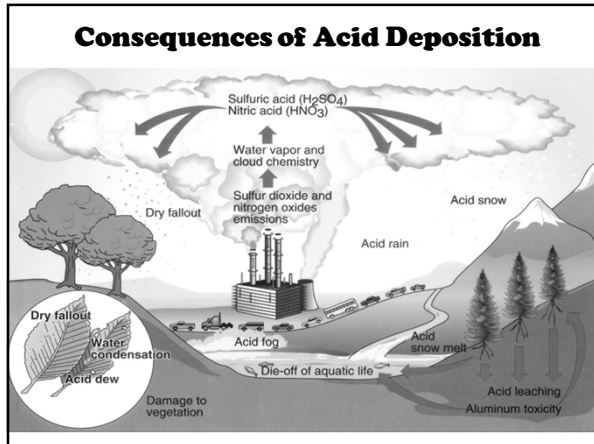

---

---

---

---

---

---

---

---

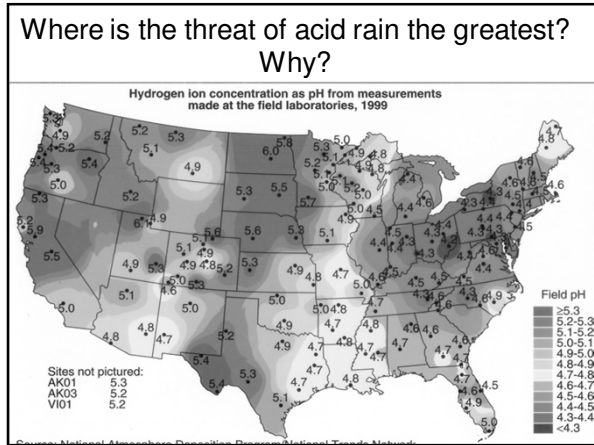

---

---

---

---

---

---

---

---

---

---

---

---

---

### Suspended Particulate Matter

- Particulate matter (PM) is both plain old dust, from roads, fields or wood, and particles formed through chemical actions.
- Other air pollutants form PM – SO<sub>2</sub>, NO<sub>x</sub>, VOC's, and ammonia.
- The size of the particle is related to the cost of removing the particle

---

---

---

---

---

---

---

---

### Particles Come in Different Shapes and Sizes

**HUMAN HAIR**  
50-70 μm (microns) in diameter

Blood cells are 6-8 microns across

90 μm (microns) in diameter  
**FINE BEACH SAND**

**PM<sub>2.5</sub>**  
Combustion particles, organic compounds, metals, etc.  
< 2.5 μm (microns) in diameter

**PM<sub>10</sub>**  
Dust, pollen, mold, etc.  
< 10 μm (microns) in diameter

---

---

---

---

---

---

---

---

### Particulate Sources

- ~ Combustion
  - ~ Smoke,
- ~ Friction
  - ~ Metal pieces,
- ~ Wind
  - ~ Sea
- ~ Life
  - ~ Skin cells,

---

---

---

---

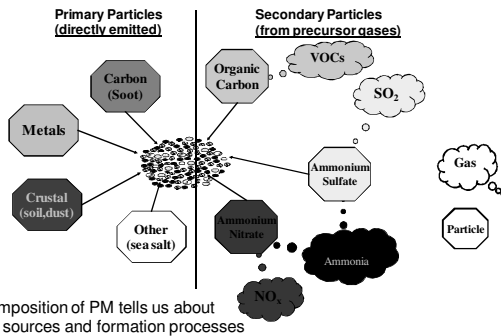

---

---

---

---

## PM Sources and Formation

---

---

---

---

---

---

---

---

## Getting Rid of PM

- Sedimentation** (settling out) only works for Coarse particles (above 2.5  $\mu\text{m}$ )
  - Residence time: seconds to one day
- Condensation** (via rain, fog, etc) works for Fine (2.5  $\mu\text{m}$ ) and larger particles
  - Residence time: days to weeks
- Coagulation** (clumping to form larger particles) is the only thing that works for ultrafine particles
  - Residence time: weeks to ...?

---

---

---

---

---

---

---

---

## Health Effects of Particulates

- *Exposure to fine particulates can cause up to a 20% permanent decrease in lung capacity*
- Living in heavily polluted areas is just as hazardous as living with a smoker
- Death rates among sick, frail, elderly and infants increase on high particulate days

## Clean Air Act 1970

---

---

---

---

---

---

---

---

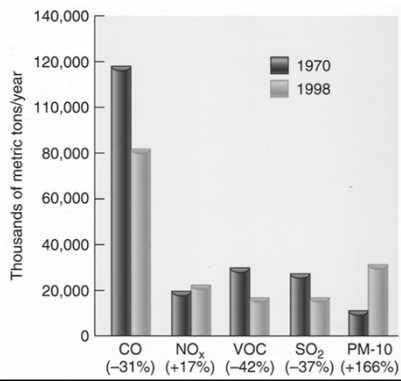

---

---

---

---

### Shift in major pollutants 1970 to 1998

---

---

---

---

---

---

---

---

---

---

---

---

### 10 Year Trends in Air Pollution

Why has the level of lead decreased?

---

---

---

---

---

---

---

---

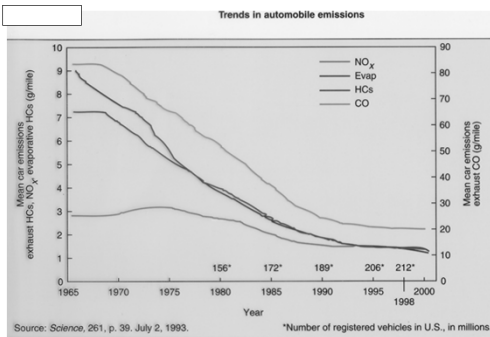

---

---

---

---

### Trends in Automobile Emissions

Is this the influence of the catalytic converter?!!

---

---

---

---

---
