UNIT I: MECHANICS Chapter 6: Newton's Second Law of Motion-Force and Acceleration

I. Force Causes Acceleration (6.1)

A. Force causes				
1. Acceleration depends on				
Objects acceleration is to the net force acting on it.				
(the symbol ∞ stands for "is directly proportional to.")				
II. Mass Resists Acceleration (6.2)				
A. Acceleration depends on				
1. acceleration produced is				
to the				
Inversely— means that the two values change indirections				
III. Newton's Second Law (6.3)				
A. Newton's Second Law states:				
The produced by a net force				
on an object is proportional to the				
of the net force, is in the same				
direction as the net force, and is				
proportional to the of the object				

	In equation form:
	1. Using units of newtons (N) for <u>force</u> , kilograms for <u>mass</u> (kg), and meters per second squared (m/s2) for <u>acceleration</u> , we get the new equation
2. I	f we let \mathbf{a} = acceleration, \mathbf{F} = force, and \mathbf{m} = mass:
IV. Friction	(6.4)
A. Fr	riction is a force
	Acts on materials that are in with each other
	2. friction acts IN direction to oppose motion
	3. friction mainly due to ir the two surfaces.
B. Fr	riction not restricted to solids sliding over one another
	1. Occurs in and
	a. both called
	b. Friction of liquids appreciable even at low speeds.
	2 (friction acting on something moving through air) is common form of fluid friction
	3. When friction is present , an object may move with a even when outside
	force is applied to it.

	a. In such case, friction for	ce		
	applied force			
	o. Can diagram using a diagram			
	PUSH	AIR RESISTANCE WEIGHT		
V. Applying force- Pr	essure			
A. Pressure-				
B. In equation	form:			
(Pressure is measured in Newton's per square meter, or pascals)				
(1 ressure is measure		——————————————————————————————————————		
VI. Free Fall Explaine	ed (6.6)			
A showed falling objects accelerate equally, regardless of their masses				
1. strict	ly true if air resistance is $_$			
2. appro	oximately true when air res	sistance is very small		
weighing tens (disproved by	times as much would fall t Galileo and others– Galile at Leaning Tower of Pisa	en times faster eo's famous		
C. Use equati $F_{\it g}$	on for weight: $= mg$ or			

Rearrange and get				
(when	$_{\scriptscriptstyle -}$ is also considered, the	acceleration of		
any object is the)			
VII. Falling and Air Resistance	(6.7)			
A. Air resistance acting on a falling object		_ the net forces		
1. When air resis	stance	downward		
force on falling object (force of gravity- also called				
) then net force is			
and <u>no</u> further		occurs.		
2 speed– when accele terminates				
	r direction (which is dow his maximum speed terr			
B. Air resistance is often	1	at low speeds,		
but very noticeable at	speeds
